Was originally going to go for a 815TQ 1U case but decided against it since this case gives me flexibility and got a better price. This backplane is based off SAS1. I have read other people using this case fine but needed further clarification. I understand that I wont ever saturate SATA III speeds with a regular

7200 RPM Drive but can saturate the speeds with a SSD  
Drive. <http://project-st.ru/userfiles/counselling-manual-pdf.xml>

Since this backplane is based on Sata 1, Do I have to worry about saturating the backplane by using all 8x 7200 RPM Drives or with SSD Drives If so what options do I have for swapping this backplane out for a more up to date one Looked on Website and no upgrade options for the specific case I bought The vendors link for specs doesnt say much Reading around here, it appears that SAS 1 expanders are limited to 2TB disks. SAS 2 fixed that. But dont quote me, I cant find the reference right now. Figure out the models. Then see if theyre compatible with your chassis. Reading around here, it appears that SAS 1 expanders are limited to 2TB disks. SAS 2 fixed that. The HBAs definitely are, but that has to be some limitation in an internal LBA buffer or something. I dont see how an expander could be costdowned in that way, since it only has to route commands and translate SATA and SAS. Of course, they might have artificially limited them. In fact, unless youre going to add external drive chassis, Id skip the expander backplanes and just get a plain, simple backplane with two SFF8087 connectors. Theres definitely a model available for your chassis and it should do SAS2 signalling. A standard 8port HBA could directly drive all eight drives. You have to use a breakout cable and each drive has it own SATA connection. Everything I read about it says it is SATA III. If it does not have an expander, like the TQ model does not, each drive requires a cable. There are other types out there but for you, this statement should clear up any confusion. So for this motherboard Supermicro X11SSHf that has 8 onboard sata ports i can jus plug into backplane and then use individual cabling to each drive on the other side. With this there should be no 2tb limitation or speed limitation. Sent from my SMG920T using Tapatalk So for this motherboard Supermicro X11SSHf that has 8 onboard sata ports i can jus plug into backplane and then use individual cabling to each drive on the other side.

With this there should be no 2tb limitation or speed limitation. Sent from my SMG920T using Tapatalk I freaked out after I ordered it and noticed the SAS1 backplane but all is well now. Thnx for all the help Sent from my SMG920T using Tapatalk The HBAs definitely are, but that has to be some limitation in an internal LBA buffer or something. I dont see how an expander could be costdowned in that way, since it only has to route commands and translate SATA and SAS. Of course, they might have artificially limited them. <http://ersanteknoloji.com/images/04-suzuki-gsxr-600-manual.pdf>

My hard drives are connected to the backplane and the backplane is connected to a HBA Adaptor. When going over the manual for the backplane there are two power connectors and I made sure they are seated fine. The manual does make mention of I2C and SGPIO for smart tests etc. I know the backplane is getting power in general because I can boot off the power button in front of the case and there are led lights flashing.Has anyone run into this issue where backplane doesnt seem to be providing power to the Hard Drives. This would be the last roadblock into getting the system running. Any and all help would be most appreciated. Thanks Is it directional Is it directionalMy fault for not reading the guides thoroughly. You just need to find another use for the reverse cable now, maybe the beginnings of a wee HTPC or something By continuing to use this site, you are consenting to our use of cookies.
