briggs and stratton 8250 generator manual

Read on for tips to ensure your Briggs generator is up and running anytime you might need it. Store it with an empty fuel tank or use treated fuel to deter gum from forming in and clogging up the fuel system. Many generators shut down automatically to protect the engine if the level gets too low. To keep yours protected and ready to go for any DIY project or home emergency, check the oil level whenever you add fuel by referencing the dipstick and filling to the full marker. Keep a few quarts of oil on hand in case of emergencies. We also offer a huge selection of affordable parts that maintain your warranty coverage on our website. Please refresh and try again. Any suggestions David I would change the spark plug, probably would be a good idea to take apart the carburetor and rebuild it and give it a good cleaning out. If there is corrosion inside the carburetor it will need to be replaced. The carburetor will need to be set up again after this. Check the condition of the fuel lines especially inside, change the fuel filter. Basically, give it a major tuneup. This normally corrects any issues such as this. If the problem persist then dive into it deeper but the engine needs to be tuned up before moving any further to pinpoint problems. Hope this helps and good luck. I did not turn off two ac units in the house. When I switched the breaker it kicked the breaker out overloaded. Now it will not generate even with the break reset. Can you tell if I need a new breaker or did something happen to the gen set itself.Did you ever find a solution It is great to LET folks know how to diagnose generator problems. I have fooled with them a time or two myself. Your offer wont help those other two guys much, but maybe some new arrivals looking on NOW can turn to you for some help. Thanks for posting and helping others! It will be stamped on the engine usually close to the valve cover. Post the model number and we will get part you need. WJA Where should I start. If you have a Voltmeter you could check and see if you are getting any power to the breaker and through the breaker. If you test and there is no power coming to the breaker then the problem will be within the generator itself. If this is the case you will need to take the generator to a repair shop. The problem could be with the stator, the rotor or any of the rectifiers or capacitors. Specialized equipment will be needed to diagnose which of these parts is bad. I hope this helps with your repair! Mark It was bought for emergency power outages such as the one we had last weekend. Unit starts fine, just not generating voltage needed.

Continuity was checked on the breaker which measured 0.1 ohm when on, and open when off. I measured 3.145VAC at the harness connector which was disconnected from the back of the receptacle panel. I checked between neutral and hot 120V, DVM read 3.145VAC across the grey and red conductors. Those two wires are going to the main stator harness. Any assistance would be appreciated. Thank you in advance. Flashing should restore power if the commutator brushes are not worn too bad. Flashing the field is very easy. All you need are two drills, one HAS to be electric, the other one needs to just have a reverse on it. Crank up the motor, plug in the electric drill. If it is reversible make sure it is set for forward clockwise the use a drill bit. Put one end in the chuck of the electric drill and then the other drill can be cordless. Set it for forward which would make the electric drill turn reverse counterclockwise. The electric drill would act like a little generator and excite the generator. But be careful because if the generator kicks in the electric drill will start up. Right Shotgun. Please try again.Please try again.We would try make same day shipping or next day shipping at least. If the porcelain insulator is cracked, an electrode is burned away or damaged, or there is heavy carbon buildup at the electrode, replace the spark plug. To determine if the spark plug is defective, use a spark plug tester.

A clogged carburetor is most commonly caused by leaving fuel in the generator for a long period of time. Over time, some of the ingredients in the fuel may evaporate, leaving behind a thicker, stickier substance. This sticky fuel can clog up the carburetor and prevent the engine from starting. If the carburetor is clogged, try cleaning it with carburetor cleaner. If cleaning the carburetor isn't effective, rebuild or replace the entire carburetor. Remove the starter assembly and inspect it to determine if it is working properly. When you pull the starter rope, tabs extending from the pulley and cam should grab the hub on the engine, causing the engine to turn. When you release the rope, the tabs should retract and the rope should rewind back on the pulley. Like all generators, the 5550 requires motor oil to operate properly. Always consult the owners manual to determine the proper oil to use and the correct schedule for oil changes. If the temperature is above 40 degrees Fahrenheit, SAE 30 oil is recommended, though at temperatures above 80 SAE 30 may not be appropriate. Between about 100 degrees and 3 degrees, 10W30 oil is appropriate. Outside of these temperatures, a synthetic 5W30 oil is appropriate, though in cold environments where the temperatures are consistently near or below freezing, 5W30 oil is appropriate. TroyBuilt

recommends Briggs and Stratton motor oil for use in the generator, but as long as the oil meets all the operational requirements of the generator, you can use any brand of motor oil that's available. Though there is a price difference, the two types offer the same range of weights and viscosity. According to Edmunds.com, modern synthetic oils provide more protection than conventional oils, even though they are usually more expensive. Troybilt recommends that oils classified as SF, SG, SH, SJ or higher are appropriate for the 5550. However, you should not use special additives. He has a Juris Doctor from the University of Kansas.
