Compaq ipaq cp-2w manual

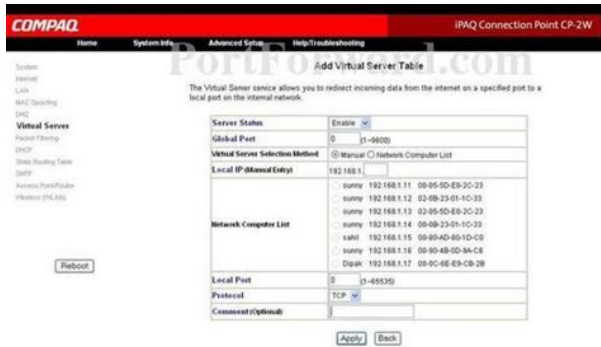

You'll find such information in the Manual of your Compaq iPAQ Connection Point CP2W router. But if you do not have the manual for your router or you do not want to read the whole manual to find the default login information then you can use the quick guide below. To get to the router login page its necessary that you are connected to the router. The default network name SSID is ConnectionPoint. The default password is blank. Sometimes the username and password doesnt work that we mentioned in the top of this guide. Did you try the following IPs In the list below we listed all known router IPs for the manufacturer Compaq. Maybe this will work for you. This can be done easily by clicking on the reset button at the back or at the bottom of your router. If you hold down this small button for approximately 20 seconds, you may have to use a toothpick, then your modem will get restored to the factory settings. What you need to keep in mind is that when you reset your modem, you will lose your connection online. It is therefore better to take an experts assistance in this regard. Since this firewall blocks incoming connections you may need open a port through it for certain games and applications. This process of opening a port is frequently called a port forward, since you are forwarding a port from the internet to your home network. Thats why we created Network Utilities. Our software does everything that you need to forward a port. This ensures that your ports will remain open even after your device reboots. Your router has a web interface, so you will login to it using your web browser. This can be either Chrome, Firefox, Internet Explorer, or Edge. It usually does not matter which browser you choose to use. It should look something like this Your routers IP address can also be refered to as your computers default gateway. If all goes well you will see the following screen Heres how you do it. <http://www.apotekatia.ba/fajlovi/example-manuals.xml>

- **compaq ipaq cp-2w manual.**

Starting from the first page in your router If you are forwarding ports so you can run a program on a device other than your computer then you can enter your devices IP address into that box. The name does not have any effect on the functionality of the forward, its simply there so you can know why it was created. They are there so you can direct traffic at two devices on your network. Lets call these devices device one192.168.1.1 and device two192.168.1.1. Okay we setup your router to forward port 21 to device one192.168.1.121. How do we get to the second device. Well the Global Port and Local Port entries allow us to specify another outside port to connect to our internal port 21. Lets make the additional port, port 30. We would now setup a rule in the router with the Public Port set to 30 and the Private port set to 21. The IP address in that rule would be 192.168.1.1. So when you wanted to ftp to device two you would specify port 30 in your ftp client. It is time to test them. Our Open Port Check tool is the only online port checking tool with Guaranteed Results. But in its own nondescript way, the Compaq iPaq Connection Point CP2W wireless broadband gateway is a thing of beauty, sporting all the features that a home or smalloffice network needs. Best of all, the instruction material is well illustrated and easy to digest. After we attached our computers to each of the four available Ethernet ports and hooked up one end of the CP2W to our cable modem, we had no difficulty getting things up and running on our small home network. The CP2W comes with one Ethernet cable to get you started. The included CDROM contains a firmware update utility, as well as an online user guide and productregistration information. Of course, your range will vary depending on the number of walls, ceilings, and other objects present in your home or office. Also, remember that youll need to install and configure a wirelessnetwork adapter in each computer you plan to network. Simply type

home into the address bar of your Web browser and follow the onscreen instructions. From here, you can also view system information, configure advanced settings, and troubleshoot your network. The CP2W handled Ethernet networking ably as well; at 88.9Mbps, it fell just a few percentage points behind the DLink, which clocked 92.3Mbps. However, the differences are negligible unless you are transferring lots of big files. When we ran a series of Webbased tests from Gibson Research Corporation, the portprobing utilities were absolutely unable to find the IP addresses of any of the computers on our network. For wireless connections, the CP2W supports 64 or 128bit WEP encryption. It also has other features you'd expect from a router of this class, including packet filtering; MAC address recognition; and support for VPN virtual private networking, DMZ demilitarized zone, and virtualserver settings. It also combines good performance with a full feature set, making it an attractive solution for a small home or office network. Measured in Mbps longer bars indicate better performance. For our wireless testing, the clients and routers are set up to transmit at short ranges and maximum signal strength. Asus latest RTAC68U will fit the bill. Let's round up its best gems. The internal DLP technology touts higher contrast, less visible pixels and more portability. Weighing in at 2.0 kg, this portable projector is bright and compact, perfect for business travelers, taking on a family vacation or just moving from room to room. I want to set up this computer to be a web server. So I put it in DMZ but it doesnt work. In fact after I had my ports scanned, I had port 21 opened but my port 80 is still showing stealth despite running IIS5. I tried with FTP server but still no luck.I did search help on the internet. They say the router is the culprit because for their routers other brands, not iPAQ they just do port 80 forwarding or put the server in DMZ and it runs fine. I use the latest firmware for my router. Any clue pleaseDont know about Verizon but you could ask them. Looking at the manual for your router you have several options to play with. Packet Filtering could keep it from working if enabled and filtering port 80. Virtual Server might work if you tell it to forward port 80. DMZ is another option. To check to see if your IIS is really working as a web server open a command line window and do netstat an and look for TCP 0.0.0.080 0.0.0.0 LISTENING Ron So I change the server port to something esle and set the port forwarding to this port in the router. It works now and I dont need DMZ. Now I have another question. In Virtual Server setting in the router has Global Port and Local Port. I set both ports to the same port in the server 8080, and it works. My question is what is the use of Global port. Can I change to something else Local is what you are really listening on. This feature lets you keep listening on your local server on port 80 and let outsiders reach you on a different port. This is called Port Address Translation PAT and is a subset of Network Address Translation NAT. Since you have already changed the port you listen on you probably want to leave it the way it is now.
